Reduced-Order Models for Thermal Radiative Transfer Based on POD-Galerkin Method and Low-Order Quasidiffusion Equations

Joseph M. Coale and Dmitriy Y. Anistratov

Department of Nuclear Engineering North Carolina State University

Modeling and Simulations in High Energy-Density Physics and Plasma Physics – M&C 2021

Radiation Transport

- We consider problems of high-energy density physics, where radiative transfer is the main mechanism of energy redistribution
 - Described by complex systems of multiphyiscal differential equations
- Numerical simulations of these complex multiphysical problems are faced with several challenges
 - Strong nonlinearity
 - Multi-scale characterization
 - High-dimensionality
- The Boltzmann transport equation (BTE) drives the dimensionality
 - The solution is 7-dimensional
 - Independent variables include: time (t), spatial position (r), direction of motion (Ω), frequency (ν) describing photons
 - Simple discretization 100 nodes each axis: 10¹² degrees of freedom
 - The high dimensionality imposes large computational burden and memory footprint
- Reduced order models for the BTE are commonly employed to reduce the problem of dimensionality

Coale & Anistratov (NCSU)

Model Order Reduction for the BTE

NC STATE UNIVERSITY

- We develop a reduced-order model (ROM) for the BTE to reduce the dimensionality of multiphysical simulations
 - Reducing both computational cost and memory requirements
- Basic idea of the model:
 - Formulate a proper orthogonal decomposition Galerkin (POD-G) projection for the BTE using known solution data
 - The photon intensities are expanded about the POD basis
 - The projected form of the BTE solves for the coefficients of this expansion for photon intensities
 - Equip the low-dimensional projected BTE with a system of low-order moment equations of the BTE
- The POD-G BTE serves to calculate closures for the moment equations, which are coupled to the specific multiphysics equations of interest

イロト イボト イヨト イヨト

Thermal Radiative Transfer

- The first prototype of this method is formulated on the multigroup thermal radiative transfer (TRT) problem in 1D slab geometry
- The high-order Boltzmann transport equation

$$\frac{1}{c} \frac{\partial I_g}{\partial t}(x,\mu,t) + \mu \frac{\partial I_g}{\partial x}(x,\mu,t) + \varkappa_g(T) I_g(x,\mu,t) = 2\pi \varkappa_g(T) B_g(T) \quad (1) \\
x \in [0,X], \quad \mu \in [-1,1], \quad g = 1,\dots, N_g, \quad t \ge 0, \\
I_g|_{\mu>0}_{x=0} = I_g^{\text{in}+}, \quad I_g|_{\mu<0}_{x=X} = I_g^{\text{in}-}, \quad I_g|_{t=0} = I_g^0, \quad (2)$$

• The material energy balance equation

$$\frac{\partial \varepsilon(T)}{\partial t} = \sum_{g=1}^{N_g} \varkappa_g(T) \left(\int_{-1}^1 I_g(x,\mu,t) d\mu - 4\pi B_g(T) \right), \quad T|_{t=0} = T_0.$$
(3)

 Supersonic radiation flow problem neglecting material motion, photon scattering, heat conduction and external sources

イロト イボト イヨト イヨト

Discretization of the BTE

- The POD-G projection method is formulated in discrete space
- The high-order Boltzmann transport equation

$$\frac{1}{c}\frac{\partial I_g}{\partial t}(x,\mu,t) + \mu \frac{\partial I_g}{\partial x}(x,\mu,t) + \varkappa_g(T)I_g(x,\mu,t) = 2\pi\varkappa_g(T)B_g(T)$$

• Discretize with: Discrete-Ordinates, Backward-Euler, Simple Corner Balance

$$\frac{1}{c\Delta t^n} \left(\mathbf{I}^n - \mathbf{I}^{n-1} \right) + \mathcal{L}_h \mathbf{I}^n + \mathcal{K}_h^n(T) \mathbf{I}^n = \mathbf{Q}^n(T) \,, \tag{4}$$

- Discrete operators \mathcal{L}_h , $\mathcal{K}_h^n(\mathcal{T})$ determined by scheme
- N_x spatial cells, N_μ discrete directions, N_t time steps,
- $D = 2N_x N_\mu N_g$
- Solution vector: $\mathbf{I}^n = ((\mathbf{I}_1^n)^\top \ \dots \ (\mathbf{I}_{N_g}^n)^\top)^\top \in \mathbb{R}^D$
- Construct snapshot matrix

$$\boldsymbol{A} = [\boldsymbol{I}^1, \dots, \boldsymbol{I}^{N_t}] \tag{5}$$

Coale & Anistratov (NCSU)

POD Basis Formulation

NC STATE UNIVERSITY

• Goal: expand intensities in basis functions $\{u_\ell\}_{\ell=1}^r$

$$\mathbf{I}_{r}^{u}(t^{n}) = \sum_{\ell=1}^{r} \lambda_{\ell}^{n} \boldsymbol{u}_{\ell}$$
(6)

• We formulate the POD basis $\{ \boldsymbol{u}_\ell \}_{\ell=1}^r, \ r \ll D$ using snapshots in \boldsymbol{A}

$$\min_{\boldsymbol{u}_1,\dots,\boldsymbol{u}_r} \sum_{n=1}^{N_t} \Delta t^n \left\| \mathbf{I}^n - \sum_{\ell=1}^r \langle \mathbf{I}^n, \boldsymbol{u}_\ell \rangle_W \boldsymbol{u}_\ell \right\|_W^2,$$
(7)

• Weighted inner product specific to the discretization: $\langle \boldsymbol{u}, \boldsymbol{v} \rangle_W = \boldsymbol{u}^\top \boldsymbol{W} \boldsymbol{v}$

< □ > < □ > < 豆 > < 豆 > < 豆 > < 豆 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

The Weighted Inner Product

NC STATE UNIVERSITY

- Standard POD uses the identity matrix $W = \mathbb{I}$ so that $\langle u, v \rangle_W = \langle u, v \rangle$
- We seek W to correspond to the discrete integration over space, angle, frequency
- For the considered discretization schemes we have

$$\int_{0}^{\infty} \int_{-1}^{1} \int_{0}^{L_{x}} u(x,\mu,\nu) dx d\mu d\nu \Rightarrow \sum_{g=1}^{N_{g}} \sum_{m=1}^{N_{\mu}} w_{m} \sum_{i=1}^{N_{x}} \frac{\Delta x_{i}}{2} (\boldsymbol{u}_{g,m,i,L} + \boldsymbol{u}_{g,m,i,R})$$
(8)

• We find the matrix ${oldsymbol W}$ as

٠

$$\boldsymbol{W} = \bigoplus_{g=1}^{N_g} \bigoplus_{m=1}^{N_{\mu}} w_m \hat{\boldsymbol{W}}^x, \quad \hat{\boldsymbol{W}}^x = \bigoplus_{i=1}^{N_x} \begin{pmatrix} \frac{\Delta x_i}{2} & 0\\ 0 & \frac{\Delta x_i}{2} \end{pmatrix}$$
(9)

Calculation of POD Basis

NC STATE UNIVERSITY

Construct snapshot matrix

$$\boldsymbol{A} = [\boldsymbol{I}^1, \dots, \boldsymbol{I}^{N_t}] \tag{10}$$

Calculate weighted snapshot matrix

$$\hat{\boldsymbol{A}} = \boldsymbol{W}^{1/2} \boldsymbol{A} \boldsymbol{D}^{1/2}, \quad \boldsymbol{D} = \text{diag}(\Delta t^1, \dots, \Delta t^{N_t})$$
(11)

Find singular value decomposition of Â

$$\hat{\boldsymbol{A}} = \hat{\boldsymbol{U}}\hat{\boldsymbol{S}}\hat{\boldsymbol{V}}^{\top}$$
(12)

$$\hat{\boldsymbol{U}} = [\hat{\boldsymbol{u}}_1, \dots, \hat{\boldsymbol{u}}_d], \quad \hat{\boldsymbol{S}} = \text{diag}(\sigma_1, \dots, \sigma_d), \quad \hat{\boldsymbol{V}} = [\hat{\boldsymbol{v}}_1, \dots, \hat{\boldsymbol{v}}_d]$$
(13)

• The POD basis is then found as $\boldsymbol{U} = [\boldsymbol{u}_1, \dots, \boldsymbol{u}_d]$ with $d = \operatorname{rank}(\hat{\boldsymbol{A}})$ using

$$\boldsymbol{U} = \boldsymbol{W}^{-1/2} \hat{\boldsymbol{U}} \tag{14}$$

Truncation Criteria & Rank Determination

- Full rank system of equations for $\{\lambda_{\ell}^n\}$ is of size d using all u_{ℓ}
- We seek a system of size $r \leq d$ using the first r basis functions in the expansion
- As r decreases, computational efficiency will increase while accuracy decreases
- We seek $r \ll D$ that will give certain level of accuracy
- Truncation criteria (tuning parameter):

$$\xi^{2} = \frac{\sum_{\ell=r+1}^{d} \sigma_{\ell}^{2}}{\sum_{\ell=1}^{d} \sigma_{\ell}^{2}}$$
(15)

- Set some ξ and find rank r that satisfies the relation above
- This allows the method to easily trade computational requirements with accuracy at will per simulation

POD Galerkin Projection

NC STATE UNIVERSITY

$$\frac{1}{c\Delta t^n} \left(\mathbf{I}^n - \mathbf{I}^{n-1} \right) + \mathcal{L}_h \mathbf{I}^n + \mathcal{K}_h^n(T) \mathbf{I}^n = \mathbf{Q}^n(T), \quad \mathbf{I}_r^u(t^n) = \sum_{\ell=1}^r \lambda_\ell^n \boldsymbol{u}_\ell$$

• POD Galerkin-Projected BTE (apply $\langle \boldsymbol{u}_{\ell}, \cdot \rangle_{W}$)

$$\frac{1}{c\Delta t^{n}} \left(\lambda_{\ell}^{n} - \lambda_{\ell}^{n-1} \right) + \sum_{\ell'=1}^{r} \lambda_{\ell'}^{n} \left\langle \boldsymbol{u}_{\ell}, \mathcal{L}_{h} \boldsymbol{u}_{\ell'} \right\rangle_{W} + \sum_{\ell'=1}^{r} \lambda_{\ell'}^{n} \left\langle \boldsymbol{u}_{\ell}, \mathcal{K}_{h}^{n}(T) \boldsymbol{u}_{\ell'} \right\rangle_{W} = \left\langle \boldsymbol{u}_{\ell}, \boldsymbol{Q}^{n}(T) \right\rangle_{W} \quad (16)$$

• Used orthogonality of basis: $\left< m{u}_{\ell'}, m{u}_{\ell} \right>_W = \delta_{\ell,\ell'}$

Multilevel Quasidiffusion Method

• High-order Boltzmann transport equation

$$\frac{1}{c}\frac{\partial I_g}{\partial t} + \mu \frac{\partial I_g}{\partial x} + \varkappa_g(T)I_g = 2\pi\varkappa_g(T)B_g(T)$$

- Eddington factor $f_g[I] = \int_{-1}^{1} \mu^2 I_g d\mu / \int_{-1}^{1} I_g d\mu$
- Multigroup quasidiffusion equations for $E_g = \frac{1}{c} \int_{-1}^{1} I_g d\mu$, $F_g = \int_{-1}^{1} \mu I_g d\mu$

$$\frac{\partial E_g}{\partial t} + \frac{\partial F_g}{\partial x} + c\varkappa_g(T)E_g = 4\pi\varkappa_g(T)B_g(T),$$

$$\frac{1}{c}\frac{\partial F_g}{\partial t} + c\frac{\partial}{\partial x}\left(f_g[I]E_g\right) + \varkappa_g(T)F_g = 0$$

• Effective grey problem for $E = \sum_{g=1}^{N_g} E_g$, $F = \sum_{g=1}^{N_g} F_g$

$$\frac{\partial E}{\partial t} + \frac{\partial F}{\partial x} + c\bar{\varkappa}_E E = c\bar{\varkappa}_B a_R T^4$$

$$\frac{1}{c} \frac{\partial F}{\partial t} + c \frac{\partial (\bar{j}E)}{\partial x} + \bar{\varkappa}_R F + \bar{\eta}E = 0$$

$$\frac{\partial \varepsilon(T)}{\partial t} = c (\bar{\varkappa}_E E - \bar{\varkappa}_B a_R T^4)$$

Coale & Anistratov (NCSU)

Reduced Order Model

• POD Galerkin Projected Boltzmann transport equation

$$\frac{1}{c\Delta t^{n}}\left(\lambda_{\ell}^{n}-\lambda_{\ell}^{n-1}\right)+\sum_{\ell'=1}^{r}\lambda_{\ell'}^{n}\left\langle \boldsymbol{u}_{\ell},\mathcal{L}_{h}\boldsymbol{u}_{\ell'}\right\rangle_{W}+\sum_{\ell'=1}^{r}\lambda_{\ell'}^{n}\left\langle \boldsymbol{u}_{\ell},\mathcal{K}_{h}^{n}(\boldsymbol{T})\boldsymbol{u}_{\ell'}\right\rangle_{W}=\left\langle \boldsymbol{u}_{\ell},\boldsymbol{\mathsf{Q}}^{n}(\boldsymbol{T})\right\rangle_{W}$$

• Approximate intensities $I_r^u = \sum_{\ell=1}^r \lambda_\ell^n u_\ell \implies \tilde{f}_g[I_r^u]$

Multigroup quasidiffusion equations

$$\frac{\partial E_g}{\partial t} + \frac{\partial F_g}{\partial x} + c\varkappa_g(T)E_g = 4\pi\varkappa_g(T)B_g(T),$$

$$\frac{1}{c}\frac{\partial F_g}{\partial t} + c\frac{\partial}{\partial x}\left(\tilde{\mathfrak{f}}_g[\mathfrak{l}_r^{\nu}]E_g\right) + \varkappa_g(T)F_g = 0$$

• Effective grey problem

$$\frac{\partial E}{\partial t} + \frac{\partial F}{\partial x} + c\bar{\varkappa}_E E = c\bar{\varkappa}_B a_R T^4$$

$$\frac{\partial F}{\partial t} + c \frac{\partial (\bar{\mathfrak{f}} E)}{\partial x} + \bar{\varkappa}_R F + \bar{\eta} E = 0$$

$$\frac{\partial \varepsilon(T)}{\partial t} = c \left(\bar{\varkappa}_E E - \bar{\varkappa}_B a_R T^4 \right)$$

Coale & Anistratov (NCSU)

Numerical Test Problem

NC STATE UNIVERSITY

- Fleck & Cummings, 1971
- 17 frequency (energy) groups
- 60 spatial cells, $\Delta x = 0.1$ cm
- $\Delta t = 2 \times 10^{-2}$ ns
- $0 \le t \le 6$ ns, 300 time steps
- DS₄ Gaussian quadrature set
- Finite volume in space & fully implicit scheme for LOQD eqs.

3

イロト イロト イヨト イヨト

Numerical Test Problem

- The F-C test is characterized by three distinct temporal stages
 - Rapid wave formation $t \in [0, 0.3ns]$
 - Propagation of wave from left to right $t \in (0.3, 1.2 \text{ns}]$
 - Slow heating of entire domain towards steady state $t \in (1.2, 6ns]$

Calculation of Basis

- We calculate a unique POD basis for each distinct stage of the F-C test
- A_1 , A_2 , A_3 with $d_i = \operatorname{rank}(A_i)$

 ranks r_i ≤ d_i are calculated based off singular values of A_i

$$\bigg(\sum_{\ell=r_i+1}^{d_i} \sigma_\ell^2 \Big/ \sum_{\ell=1}^{d_i} \sigma_\ell^2 \bigg)^{\frac{1}{2}} < \xi$$

- Stage 1 (r_1): full rank = 15
- Stage 2 (r_2): full rank = 45
- Stage 3 (r_3): full rank = 240

590

- We developed and tested a prototype advanced ROM for TRT in 1D geometry
- A POD Galerkin-Projected BTE is coupled with the low-order quasidiffusion equations to give approximate closure
- The Projected BTE is dense but contains many less degrees of freedom compared to the original BTE
- The expansion coefficients directly depend on material temperature, making the ROM naturally parametric
- The ROM was shown to produce highly accurate solutions, and converge uniformly to the reference solution as rank is increased
- Results are promising, and future work includes:
 - Extension of the method into 2D geometry
 - Investigation into performance over given parametric spaces
